

# WORK SMART

## Working better together

### Today and tomorrow

The Internet. Smartphones. The cloud. Within just 10 years, digitalisation has fundamentally changed the way we work together. Today we can set up online meetings, quickly integrate video support and share our desktops worldwide with just few clicks. This development is far from over, however. Virtual reality, intuitive touch technologies, 3D scanners/printers and digital assistants will further revolutionise our daily work together in the near future.

#### Today

**All information in one place**  
Today all information is accessible to all employees from everywhere. Thanks to Internet and cloud technologies, the relevant data can be more quickly found and more easily shared.

**At all times and everywhere**  
Chat, IP telephony, mobile Internet, desktop sharing and online collaboration nowadays make it possible to work together in a flexible manner with colleagues and partners who were previously inaccessible for geographical reasons.

**The appropriate workspace**  
Fixed workplaces are now being gradually transformed into flexible office landscapes: quiet rooms for concentration, lounges for talking, stimulation for creativity, and the home office for flexibility.

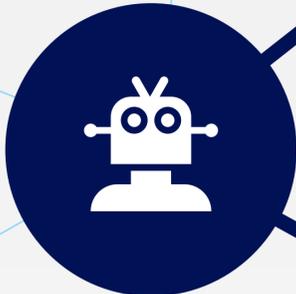

**Easy 3D scanning**  
Physical objects will be able to be quickly and easily captured as 3D models in the workplace in the near future. On this basis developers worldwide will optimise prototypes together around the clock.

**Grasping by touch**  
With intuitive touch operations, we can navigate in an ever-growing number of applications even faster. As a result, work on 3D models will greatly accelerate in the coming months.

**Convenient 3D printing**  
It is no longer the case that ideas and plans can only be visualised on screen. In the near future, physical models and spare parts will be conveniently produced in the office with a 3D printer.

**Intelligent digital assistants**  
In the coming months and years, digital assistants will relieve us of an ever-increasing amount of tedious organisational work: From scheduling to finding free meeting rooms to ascertaining the fastest travel route.

**Hands-free virtually**  
Virtual reality technologies like Google Glass will soon project plans or dialogue partners directly in our field of view. Individual areas and details can be selectively singled out and refined – and your hands remain free for practical work.

Ready for tomorrow today?

**Take the first step!**
