

It's important to protect sensitive data and critical infrastructures. Companies opting for Swisscom Mobile ID are choosing an end-to-end security solution and retaining complete control of all their data.

Secure, strong authentication solution for companies in Switzerland

What is Swisscom Mobile ID?

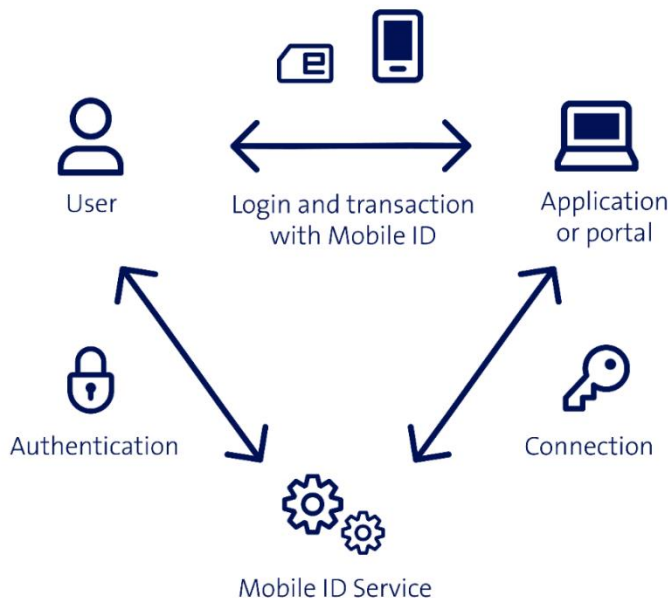

The Swisscom Mobile ID authentication solution protects access to your company data and applications with a comprehensive end-to-end solution for two-factor authentication (2FA). Mobile ID can be used in multiple processes: everything from the simple addition of a second factor to an existing login, to password-free two-factor authentication, online signatures and geo-location. It is suitable for different system landscapes and meets strict regulatory requirements.

Your benefits with Swisscom Mobile ID

- Flexible solution for different applications and platforms
- Whether it's for use in the cloud, your own data centre or remotely: you provide a consistent user experience in different system landscapes
- Easy to install and use with practical self-service
- Professional help – from introduction to ongoing support
- Mobile providers ensure the logistics and distribution of the hardware
- Scalable and highly available – provided in Switzerland

Swisscom Mobile ID is ideal for companies looking for a competent solution partner that can also handle complex requirements.

Solution at a glance

Facts & figures

Technical features

Simple expansion of existing solutions for secure two-factor authentication without the need to adapt software or extend existing user interfaces

Proven protocols like SOAP/XML, HTTP REST, RADIUS or SAML can be used in the login process and are compatible with solutions such as Microsoft ADFS

End-to-end redundancy from the Swisscom application platform, via various communication channels, to the authentication application on mobile devices

Proven cryptographic algorithms and concepts ensure simple and transparent procedures in security-critical applications such as e-banking

Replacement of access via hardware tokens, SMS and password solutions

Status information allows individual optimisation of user processes and expansion of in-house monitoring and alerting measures

Can be used independently of mobile phone coverage on app or SIM via WLAN

Typical applications

Supplementing the traditional user name and password login data with a Swisscom Mobile ID confirmation

No tokens, rollouts, hardware or app maintenance: you don't need software on the device or specific GUIs as applications can be integrated via standard interfaces. Mobile ID is the **easiest way to secure VPN or remote desktop solutions**.

With simple authentication, you increase the number of logged-in users compared to guests, strengthen customer loyalty and offer an **improved web experience**.

Securing information systems with Mobile ID allows easy access without compromising your information. Mobile ID works for B2B applications as well as for B2C portals like e-banking, e-health or cloud services.

Geo-Fencing can be used to limit access authorisations geographically. Swisscom Mobile ID provides reliable location data as the foundation for access control.

It provides straightforward **transaction or order confirmation in customer service** using a smartphone; for example, for traceable expressions of intent for creating qualified electronic signatures.

Suitable for **business applications, customer portals and local authority applications**
