Setting up the Privacy Option for Centro Business

1.1 Need

You would like to ensure that the LAN data for your router, such as your router password or WLAN access data, is stored with Swisscom.

1.2 Description

Access data such as your router password, WLAN key (SSID) and WLAN password are stored in encrypted form in your Swisscom Customer Centre. You can access this information in your Customer Centre if you forget a password or WLAN key. If you replace your Centro Business router or press the factory reset button, this data will automatically be transmitted from the Customer Centre to your router. The available Swisscom set-up guides also use this data. For example: automatic WLAN configuration on your smartphone or PC.

If you enable the **Privacy Option**, you will prevent your router LAN data being stored in the Swisscom Customer Centre, while existing data will be deleted.

1.3 Requirements/limitations

Requirements:

- Swisscom contract: Business Internet Services, My SME Office
- Firmware Version
 - Centro Business 1.0: 07.06.04 or higher
 - Centro Business 2.0: 8.00.04 or higher

Limitations:

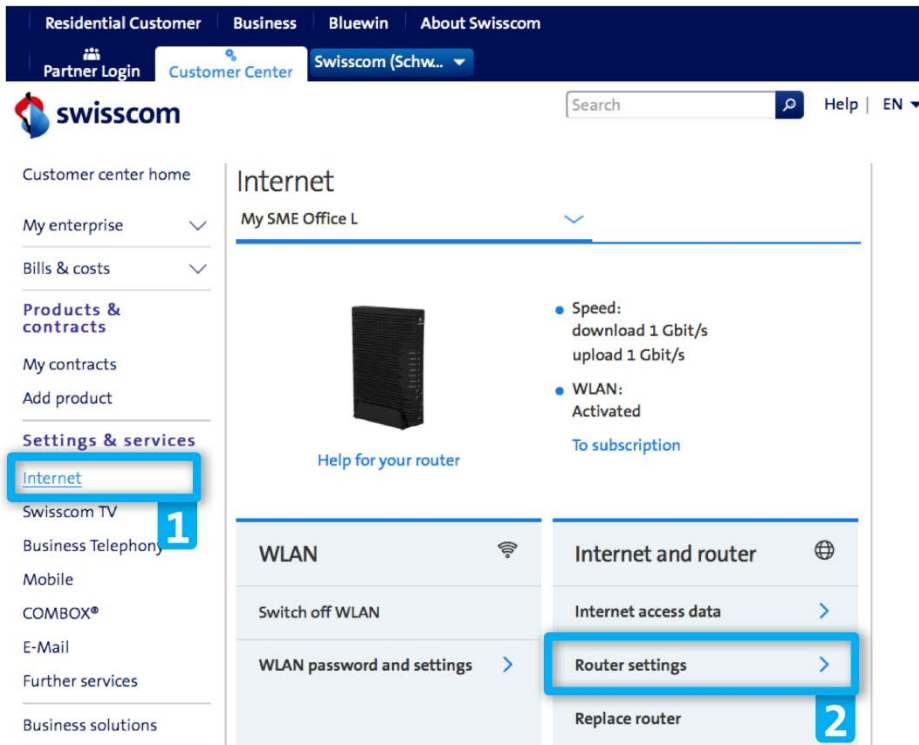

- None

1.4 Illustration

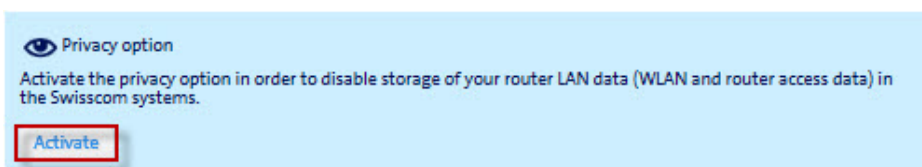

None

1.5 Checking or adapting the Privacy Option

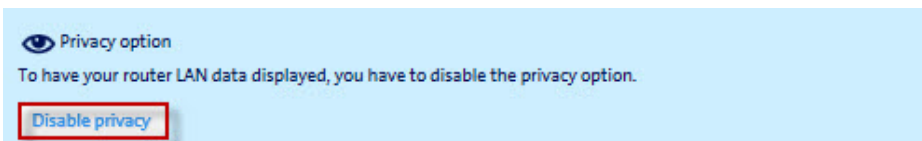

Log into your Customer Centre. Click on the Internet tab and then on **Router settings**.

The current status of the Privacy Option for your connection will now be displayed. In order to activate the option, click on **Activate**.

The WLAN and router access data will no longer be transmitted to the Customer Centre or displayed. Once the option is activated, you can deactivate it by clicking on **Disable privacy**.

The WLAN and router access data are now transmitted to the Customer Centre again. If necessary, you can now read this data again.
