1 Intro

This document describes the NG112 reference test cases for Voice Service Providers (VSP) and Public Safety Answering Points (PSAP). The tests can be carried out on the referenced LIS and LIS proxy. The test cases are used to check the successful implementation at the VSP and PSAP.

1.1 Management summary

With the OFCOM Regulation 2021 the NG112 emergency communication according to ETSI ES 203 178 will be introduced in Switzerland. Contrary to the standard, the ANP are not regulated and do not have their own Location Information Server (LIS).

In consequence the Voice Service Providers (VSP) have to send the network-based and the device-based location of emergency calls with the HELD protocol over the interface <ic> into the Swiss central LIS from Swisscom (Schweiz) AG.

The VSPs have to route the emergency call to the responsible Public Safety Answering Point (PSAP) and send information (PAI, Geolocation, ...) about the stored location to LIS within the SIP-INVITE.

The PSAP receives the emergency call. Inside the SIP-INVITE (PAI, Geolocation, Call-info) the PSAP will find the information for requesting the location information with HELD over the interface <im> at the LIS-Proxy.

The suppliers of VSPs and PSAPs have to implement the new HELD interfaces for communication with LIS or LIS-Proxy and need to test it. For this purpose, predefined test cases were recorded at the reference LIS (test server). The input and output are unambiguously defined and allow the functionalities at VSP and PSAP to be tested. Only HELD and the interfaces <ic> and <im> is in the scope of these test cases. SIP and SIP-INVITE are not in scope. The data in the test cases are artificial and only for functional verification.

[For any other service regression testing other than covered in this document we refer to existing documents of suppliers, vendors, operators, integrators and providers.](#)

For the sake of readability, the test response data documented below primarily show the location-related part of the concerning response. The response contains additional fields (XML tags) which are not documented in detail, for instance DataProviderString (example value "Swisscom (Schweiz) AG") or ProviderID (example value "22801"). Of course, these fields need to be processed correctly as well.

1.2 Goal of the document

This document describes the reference test cases for LIS, LIS-Proxy, HELD and the interfaces <ic> and <im>.

[This document does not cover conveyance of location information and references in the SIP protocol.](#)

1.3 Intended audience

- Voice Service Provider
- PSAPs
- Suppliers/Vendors of VSP and PSAP

Useful knowledge:

- Computer system and Internet
- Basics of emergency call handling
- Basics of protocols such as HTTP, HELD, PIDF-LO, XML

1.4 Referenced documents

No.	Name of document	Description
[1]	ETSI ES 203 178	Functional architecture to support European requirements on emergency caller location determination and transport
[2]	ETSI TS 103 479	Core elements for network independent access to emergency services
[3]	NG112_Interfaces_V3.0.pdf	Description of used protocol at interfaces <ic> and <im> see https://swisscom.com/emergencylocalization
[4]	NG112-CH_XSD-3.0.zip	XML schema definition of <ic> and <im> see https://swisscom.com/emergencylocalization

Tabelle 1: Referenced documents

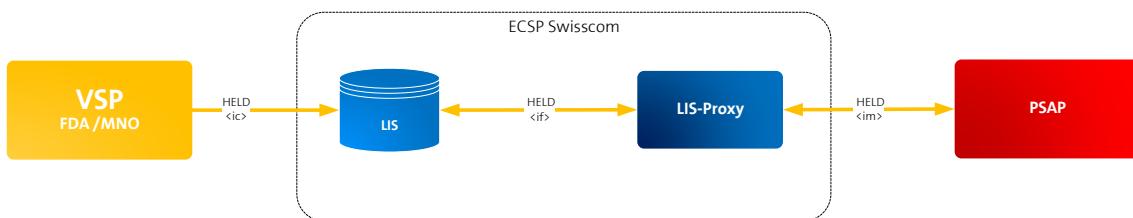

1.5 Glossary

Term	Definition
AML	Advanced Mobile Location is a function within the Apple iOS and corresponds to ELS
EGID	Federal building identifier
ELS	Emergency Location Service for Android, corresponds to AML
ETSI	European Telecommunications Standards Institute
GNSS	Global Navigation Satellite System
LbyR	Location By Reference, refers to the conveyance of a URL in the SIP INVITE, which points to location information in an LIS, e.g. https://lis.swisscom.com/iig4riubr4wbv
LIS	Location Information Server, components in an access network that determine the location (coordinates, address) of a user of the access network.
LIS-Proxy	Central Location Information Server in a country that obtains information from localised LISs and can store information itself.
MSD	Minimum Set of Data for an eCall
OFCOM	Federal Office of Communications. Approves the regulations for telephony in Switzerland.
PAI	P-Asserted-Identity, SIP header field, see RFC3325
PIDF-LO	Presence Information Date Format Location Object – a Presence-based GEOPRIV Location Object Format (XML)
PSAP	Public Safety Answering Point – call center for emergency services, emergency response center
UA	User Agent (SIP endpoint); often (for 3GPP) also referred to as UE, User Equipment.
UE	User Equipment
URI	Uniform Ressource Identifier
VSP	Voice Service Provider

Tabelle 2: Glossary

2 Test and reference Infrastructure

For testing purpose, dedicated test equipment (test LIS and test LIS-Proxy) is available. On the LIS there are pre-defined test cases for PSAP and VSP implemented for validating functionality. The predefined test cases can be called up via the interfaces <ic> and <im>.

Picture 1: Testinfrastructure

To reach the test infrastructure of LIS and LIS proxy, the following URL can be used

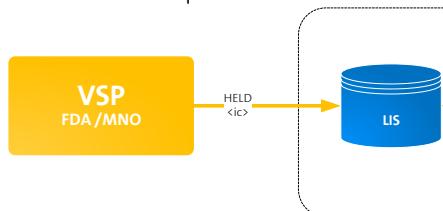

For the interface <ic> use the URL <https://ref-lis.soservice.ch:8443>

For the interface <im> use the URL <https://ref-lisproxy.soservice.ch:8443>

For access and questions please Contact: <mailto:ApplicationManagement.E112@swisscom.com>

3 Test cases VSP over interface <ic>

Test cases can be sent over the interface <ic> to the Swiss LIS <https://ref-lis.soservice.ch:8443> with a HTTP POST and the HELD-Request.

The interface description NG112_Schnittstellen_3.0_EN.pdf and the NG112_XSD_3.0.zip can be found at <https://swisscom.com/emergencylocalization>.

The reference test case is based on the examples out of the NG112_XSD_3.0.zip. If the existing examples are used, please change the User Part (number) of the SIP-URI, see role below!

When the HELD-Request (reference test case or your own request) is sent to the LIS, you will get a HELD-Response. If the request is valid, you will get a LocationURI like "**LISResponse-LocationURI.xml**" of the examples. If the request is not valid you will get an error like "**LISError.xml**" of the examples.

Please do not use the numbers (user part of SIP-URI) of the PSAP-Testcases in chapter 4! User Part (number) of SIP-URI WireLine test cases from +41590000001 to +41590000049 and WireLess test cases from +41790000001 to +41790000099

3.1 VSP: Netbased location

3.1.1 WireLess

"LISRequest-WireLess-Geodetic-Ellipses.xml" is the example of WireLess netbased location described with ellipses. "LISRequest-WireLess-Geodetic-Polygones.xml" is the example of WireLess netbased location described with polygons.

3.1.2 WireLine

"LISRequest-WireLine-Civic.xml" is the example of WireLine netbased location described with address.

3.1.3 Wifi Calling

"LISRequest-WireLess-VoWIFI-IPLoc.xml" is the example of WireLine netbased location of wifi calling about IP described with address. "LISRequest-WireLess-VoWIFI-LastCell.xml" is the example of WireLess netbased location of wifi calling about last Cell described with ellipses.

3.2 VSP: Devicebased location

3.2.1 eCall

"LISRequest-eCall-MSDXML.xml" is the example of Device based location of eCall described as MSD.

3.2.2 AML@SMS

"LISRequest-AML@SMS.xml" is the example of Device based location of AML@SMS described as Circle with a point and confidence.

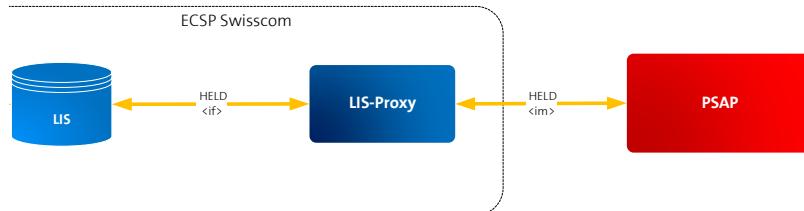

3.2.3 AML@SIP

"LISRequest-AML@SIP.xml" is the example of Device based location of AML@SMS described as GNSS position, means circle with a point confidence, speed and direction (heading).

4 Test cases PSAP over interface <im>

You can get the follow reference test cases over the interface <im> for the Swiss LIS-Proxy <https://ref-lisproxy.soservice.ch:8443> with a HTTP POST and the HELD-Request.

You have two possibilities to request a case, with the **LocationURI** or with the **SIP-URI**.

```

POST /location HTTP/1.1
Host: ref-lisproxy.soservice.ch:8443
Content-Type: application/held+xml; charset=utf-8
Content-Length: 234
X-Correlation-ID: afc3d814-83c0-4cc8-a693-c80305f9a008
<?xml version="1.0" encoding="UTF-8"?>
<locationRequest
    xmlns="urn:ietf:params:xml:ns:geopriv:held">
    <locationURI>https://lis.soservice.ch:8443/location/abcde12345678</locationURI>
</locationRequest>
    
```

```

POST /location HTTP/1.1
Host: ref-lisproxy.soservice.ch:8443
Content-Type: application/held+xml; charset=utf-8
Content-Length: 257
X-Correlation-ID: afc3d814-83c0-4cc8-a693-c80305f9a008
<?xml version="1.0" encoding="UTF-8"?>
<locationRequest
    xmlns="urn:ietf:params:xml:ns:geopriv:held"
    xmlns:id="urn:ietf:params:xml:ns:geopriv:held:id">
    <id:device>
        <id:uri>sip:+41790000000@example.com</id:uri>
    </id:device>
</locationRequest>
    
```

The interface description NG112_Schnittstellen_3.0_EN.pdf and the NG112_XSD_3.0.zip you will find at <https://swisscom.com/emergencylocalization>.

4.1 PSAP: Netbased location only

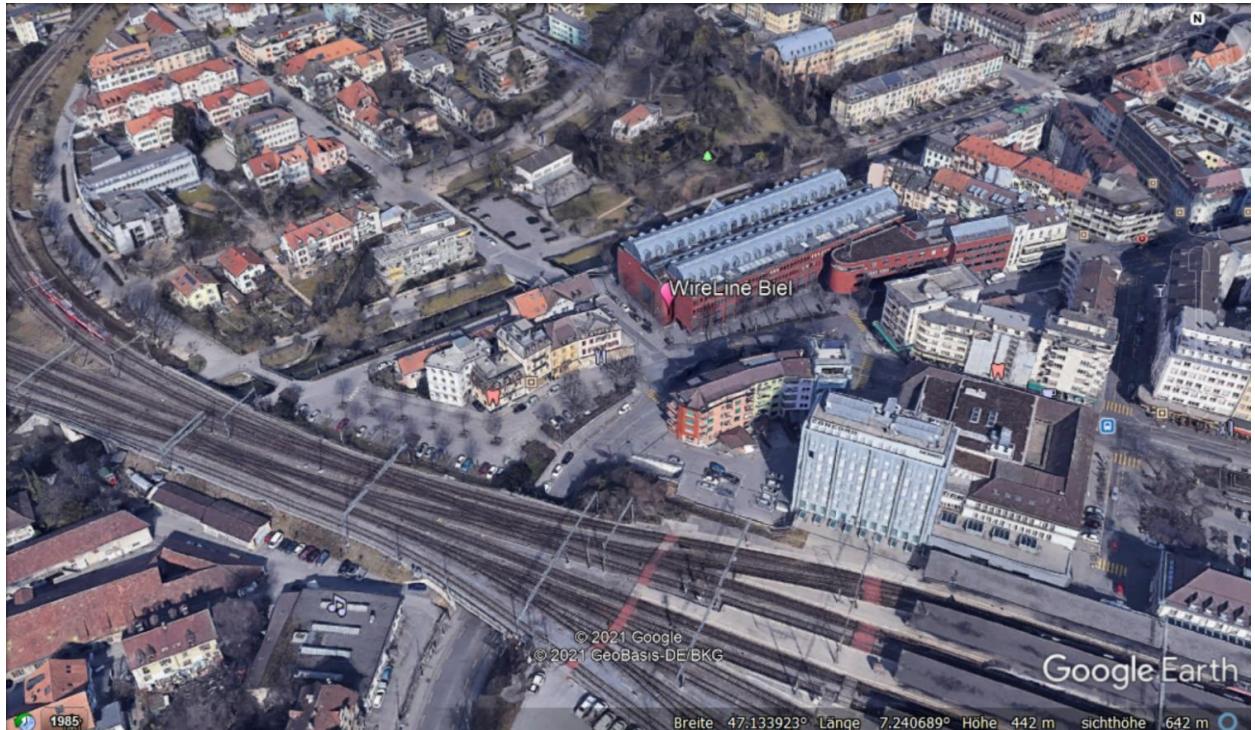

In chapter 4.1 there are test cases with netbased locations only.

4.1.1 WireLine, Fixnet, Wifi-Calling (IP-localization)

These are WireLine, Fixnet, Wifi-Calling test cases which are localized at an address in Switzerland. The PSAP get as result an address with the coordinate and can show the point with the address data.

The address data can be street name, street number, place, postcode **OR** house name, place, postcode.

4.1.1.1 Biel

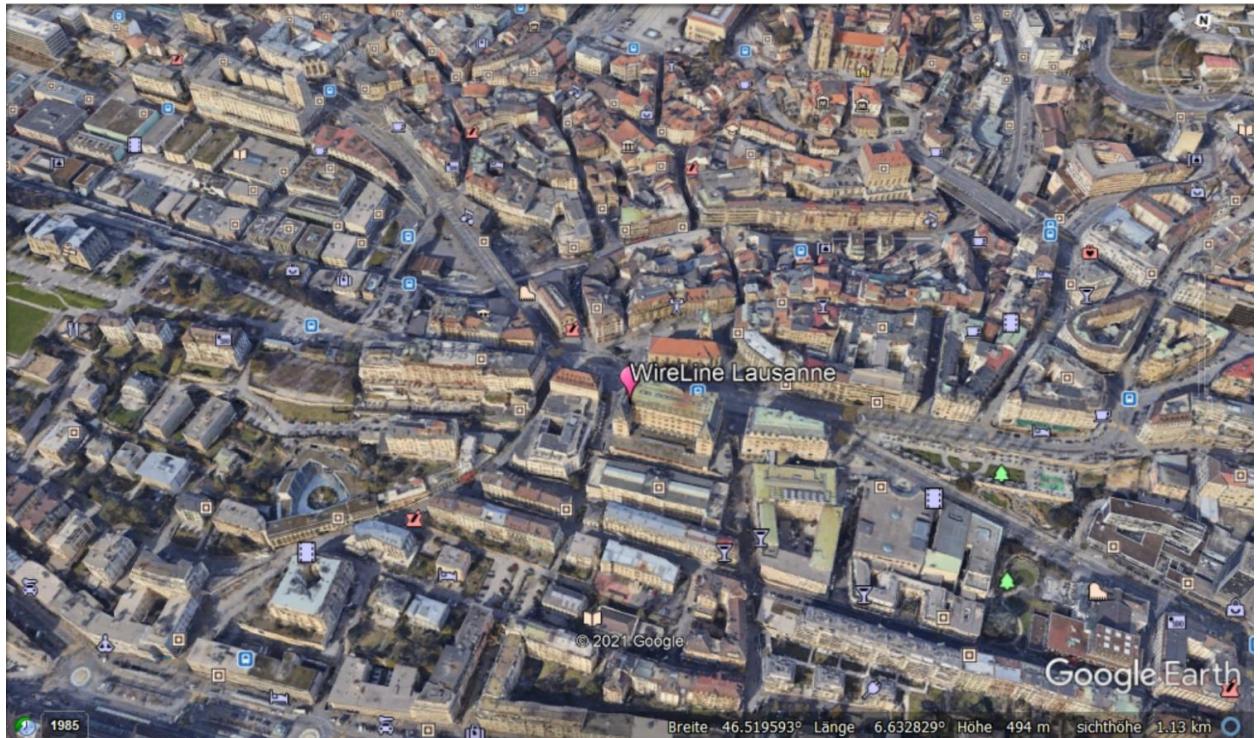

Swisscom (Schweiz) AG
Aarbergstrasse 107
2501 Biel BE

SIP-URI: +41590000001@example.swisscom.com

4.2 PSAP: Devicebased location only

In chapter 4.2 test cases only with devicebased locations for AML and eCall and the specific data are described. AML specific location data like GNSS. Min. with a point, a circle around the point and a confidence. Max. you get additional the height (heading) and/or speed and/or direction (orientation).
eCall specific location data are a point in milliarcseconds and the last two points in different of the current point. The direction where the vehicle was driving, the number of occupants, the type of vehicle, which energy is used and some other information.

4.2.1 AML

AML specific location data like GNSS. Min. with a point, a circle around the point and a confidence. Max. you get additional information like the heading (device is moving to) and/or orientation (direction where device is looking to) and/or speed.
