

Success Story

Gebäudeversicherung Bern

The challenge

In recent years, there have been fires that have caused significant damage. Many buildings were not equipped with smoke or fire alarm systems, as the available systems were very expensive. The Gebäudeversicherung Bern therefore wanted a simple and cost-effective solution to equip existing buildings with networked smoke detectors and connect them directly to the blue light organisation. By optimising the alarm process with the new solution, fire damage could be effectively minimised.

Automatic alerting of the emergency services within seconds

Reduction of damage to buildings and danger to life

Minimization of operational losses and economic relief for insurance companies

The solution

Segura360 was developed in collaboration between Gebäudeversicherung Bern, Morpho Ltd. and Swisscom: a wireless fire and smoke alarm system that is continuously monitored and was developed as an alternative for properties without mandatory systems. In an emergency, it automatically triggers protective measures and alerts the emergency services. By modifying and integrating Multisense into the smoke detectors and embedding LPN Connectivity, Swisscom was able to pave the way for the current solution Segura360.
